

Stock IQ is your partner in managing supply chain uncertainty

Supply chain disruptions are no longer one-off events. From the COVID-19 pandemic to the latest round of tariff threats and trade wars, the only constant seems to be uncertainty.

“Waiting it out” is no longer an option as global supply chains become more and more complex and volatile. The best planners are prepared, and arm themselves with the right tools to manage these changes.

Stock IQ can help your team make data-driven forecasting and replenishment decisions with capabilities that far exceed native ERP tools and home-grown Excel spreadsheets. Here are five reasons why Stock IQ is mission-critical for supply chain planners with the backdrop of unpredictable tariffs and extended demand uncertainty:

1. Clear ROI:

Stock IQ users report up to a 50% reduction in stock outs and 30% reduction in inventory. As input costs go up, there is pressure on margins and every dollar matters. Easily rationalize underperforming SKUs and avoid excess ordering (especially from high-tariff countries of origin) to trim the fat.

2. Time savings for your team

Maintaining business continuity in the face of tariffs requires creative thinking. Supply chain teams need to be nimble and ready to react to any new updates. StockIQ

users can see a 70% decrease in planning time. Planners spend less time on the day-to-day tasks which frees up more capacity from strategic problem-solving instead.

3. Incorporate new facts and calculations

As tariff rates and affected countries keep changing, you don't want to be constantly making manual updates to a spreadsheet model. Stock IQ allows you to easily add information on country-of-origin and tariff rates making it possible to run reports around the fully loaded landed costs, anticipated margins by SKU and site, and time to stock out. This ensures you are always making decisions based on the latest available information.

4. Easy scenario-modeling

You may want to run multiple scenarios or adjust your consensus forecasts to account for potential volatility in demand in response to higher prices. Stock IQ's trend model can automatically be adjusted to view and assess the impacts of various changes.

5. Trusted partner in supply chain management

You're not in this alone. StockIQ users become part of a broader community of demand planners and supply chain executives. You can stay on top of the latest in supply chain management strategies through our regular content series and regional user conferences.

Don't suffer the costs of waiting.
